Homework 4

"Angular"

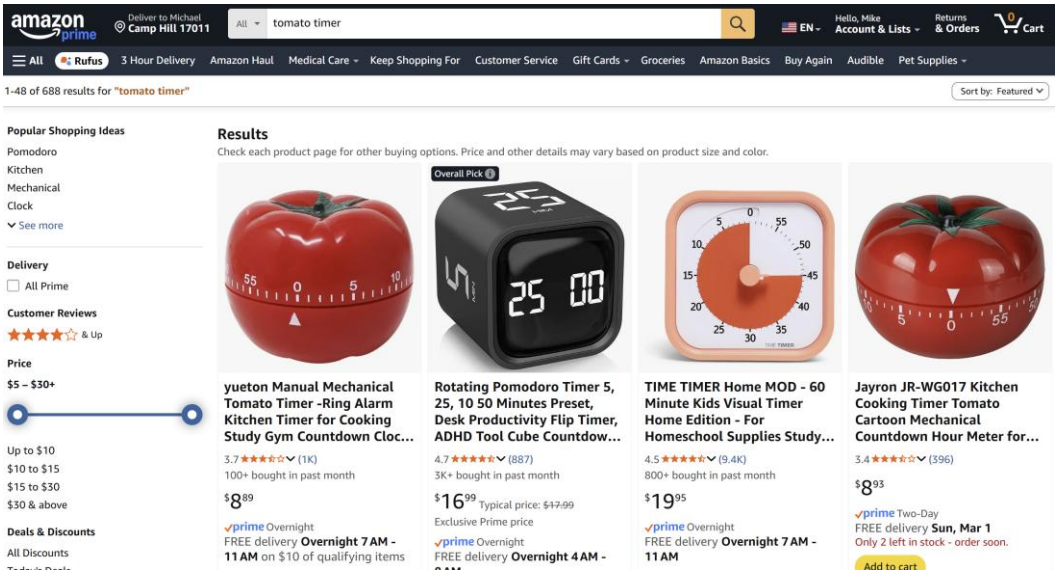
The following problem set is worth 100 points total. Please submit a zip file containing all relevant code to the Canvas drop box by the due date of the assignment.

Requirements

This assignment goes over a new JavaScript (or in this case TypeScript) framework known as Angular.

LoFi Beats Pomodoro Timer (100 pts)

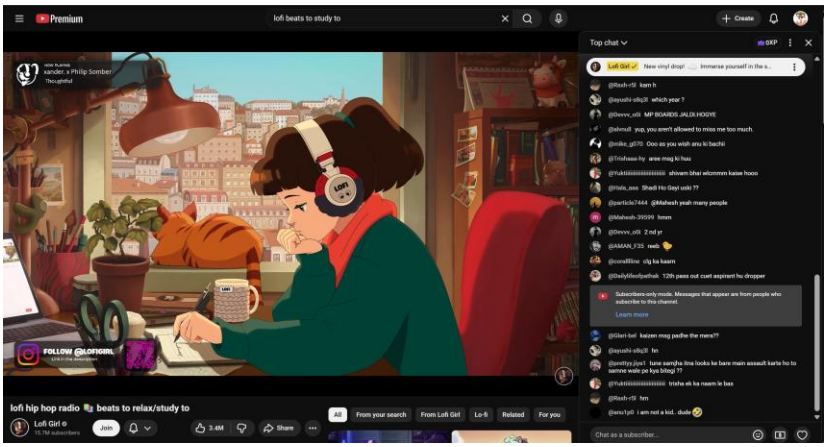
A **Pomodoro timer** is a tool that people use for productivity during work hours. You can purchase physical timers on Amazon (e.g. "tomato timers"):



People use these throughout the day when they want to focus on a task for a short period of time, for instance 25 minutes. People turn off all noise and distractions, set the timer and then work continuously until the timer is completed. They'll then take a short break and then repeat the process. The user will eventually keep track of the number of "Pomodoros" that were completed during the workday.

Lo-Fi Beats to Study To

There are several YouTube channels which simply play lo-fidelity beats you can listen to. These are generally live streams on the platform that serve relaxing tunes while you work/code/study throughout the day.



Assignment Details

For this assignment produce an Angular application which performs the following requirements:

- The application uses the latest version of Angular (defined in **package.json**).
- Your interface has two inputs:
  - A button that is clickable which starts a 25-minute timer
  - An input field pertaining to a task name that the user wants to complete
- While the timer is running, you should play an MP3 file from the following categories:
  - Rain Sounds
  - Café Noise
  - Lo-Fi Beats
- Use **royalty-free MP3 files** (easily found on the internet)
- When the timer is completed, store the task in a list of completed tasks.
- Incorporate RxJS intervals (for your timers) and a package called Howler (on NPM) for playing your MP3 files

Also incorporate Angular router with the following two routes:

- / -> the root of your application which has the core timer functionality (button and input)
- /completed -> a page showing the list of completed tasks

Submission Requirements

For submission, upload a zip file containing all assets I need to run your application. Do not include the **node_modules** directory in your submission.

You do not need to use Node for this assignment (I'll go over Vue in the coming weeks in the course). Submit using the Canvas drop box before the due date.
